LEDVISTA Lighting Limited

LEDVISTA Limited is an enterprise dedicated to the supply of world class LED lighting to business and consumer markets. We speak to Peter English about the firm's work and the exciting future that lies ahead for the firm.

Established seven years ago, LEDVISTA Lighting Limited specialises in high quality LED lighting, with a focus on servicing sectors such as hospitality, retail, office & commercial, industrial, and municipal projects. The LEDVISTA website (www.ledvista.ie) is rapidly expanding with the aim to provide expert advice on the latest LED lighting technology available as well as providing a comprehensive on-line shop to the consumer market for home lighting.

My own background is in the semiconductor industry, which I apply frequently to my work within the company as LED lighting is a semiconductor technology (Light Emitting Diodes).

Alongside our technical expertise and knowledge of the LED lighting industry, the firm has formed strong bonds with global market leading LED lighting manufacturers, coupled with a growing a considerable and diverse client base, which have helped us to grow and reach the success of winning this prestigious title.

We are particularly proud and encouraged to have won this title, as it is great to be recognised by an independent source. LEDVISTA Lighting has won awards in the past but this title is particularly prestigious and the recognition means a lot to us.

Our firm has an exciting future ahead, with many emerging LED lighting technology developments in the industry set to provide us with a number of opportunities for growth and expansion.

Technology is evolving in all markets and lighting is no exception. LEDVISTA Lighting Limited is fortunate to be well positioned at the forefront of major technological developments thanks to our strong ties within the industry and our attendance to a number of events such as major lighting shows, which showcase the latest technology in the sector.

A major upcoming trend which is set to bring in Intelligent (Smart) Lighting is the 'Internet of Things' (IoT), which will enable users to control their lighting wirelessly and remotely, using portable devices such as their smart-phones and also bring about a host of new ways to utilise LED lights. We are embracing this change and preparing the necessary resources to offer the benefits coming from the new IoT era with respect to lighting systems.

It is not just the lighting industry that is developing and growing strongly. The Irish economy is finally in full recovery following the economic and banking sector melt-down of 2008, and as such construction activity is increasing rapidly with a strong emphasis on energy efficiency and green technology, providing us with the opportunity to grow further with this significant upturn.
